A. Effect of t_death choice on HUNT4 fit quality
Re-fitted k, b for each sigma0
HUNT4 data (men)
Canonical (~77) RMSE=0.016
Tls=82 (Norway) RMSE=0.015
Tls=85 RMSE=0.015
T_max=122 (Cagan) RMSE=0.013
T_max=122:
smaller DeltaSigma
but still fits
VO2max / VO2max(25 yr)
Age (yr)
B. DeltaSigma(t) under different sigma0 calibrations
all give nonzero, accelerating DeltaSigma in 25-85 yr
Canonical (~77) (sigma0=0.0162)
Tls=82 (Norway) (sigma0=0.0143)
Tls=85 (sigma0=0.0134)
T_max=122 (Cagan) (sigma0=0.0076)
DeltaSigma(t) = Sigma(t) - Sigma(25)
Age (yr)
Key result:
VO2max fit is ROBUST
to the t_death choice:
all calibrations give
RMSE 0.013-0.016.
k,b absorb sigma0;
the SHAPE of DeltaSigma
is what is tested.
