A. Effect of t_death choice on HUNT4 fit quality
Re-fitted k, b for each sigma0
HUNT4 data (men)
Canonical (~77) RMSE=0.027
Tls=82 (Norway) RMSE=0.026
Tls=85 RMSE=0.026
T_max=122 (Cagan) RMSE=0.026
T_max=122:
smaller DeltaSigma
but still fits
VO2max / VO2max(25 yr)
Age (yr)
B. DeltaSigma(t) under different sigma0 calibrations
all give a nonzero, growing DeltaSigma over 25-85 yr
Canonical (~77) (sigma0=0.0162)
Tls=82 (Norway) (sigma0=0.0143)
Tls=85 (sigma0=0.0134)
T_max=122 (Cagan) (sigma0=0.0078)
DeltaSigma(t) = Sigma(t) - Sigma(25)
Age (yr)
The fit hardly depends
on the t_death choice:
RMSE 0.026-0.027.
k and b are refitted for
each sigma0, so the fit
does not discriminate
between the calibrations.
